

Attention fell, and efficiency followed

Findings from a marketing BI dashboard · Facebook, Pinterest and Snapchat · Sep 1 to Dec 31, 2025

The question: what happens to a person who sees our videos, and was it worth the spend? Across 59.2M people reached, 74M impressions and about 800K invested, four findings answer it.

THE FOUR FINDINGS

- **Reach and engagement held steady, attention did not.** Reach varied 3.95% and engagement rate 1.47% between months, but the view-through rate (VTR) fell from 13.5% in September to 8.4% in November.
- **Efficiency moved with it.** Cost per conversion rose from 45 to 72 and ROAS fell from 0.65 to 0.41 in the same months. The metrics move together; this analysis does not show that one causes the other.
- **Platforms trade off.** Pinterest leads attention, clicks and efficiency. Snapchat leads interaction (5.2% engagement) but is below average on attention and clicks, and is the least efficient.
- **Three contents are outliers.** Rayo, Tiburon and Galaxia have about double the attention and click rate of the rest, and in the underlying data they are the only contents with ROAS above 1.

HOW I MEASURED IT: FROM EXPOSURE TO RESULT

Group	Metric	Question it answers	Formula
Volume	Reach · Impressions · Views · Frequency	How big was it? How often did each person see it?	$\text{Frequency} = \text{Impressions} / \text{Reach}$
Funnel	Attention: VTR	Did they stop to watch?	$\text{Views} / \text{Impressions}$
	Retention: VCR	Did they stay until the end?	$\text{Video completions} / \text{Views}$
	Interaction: ER	Did they react?	$(\text{Likes} + \text{comments} + \text{shares} + \text{saves}) / \text{Reach}$
	Action: CTR	Did they click?	$\text{Clicks} / \text{Impressions}$
Cost	Spend	How much did we invest?	Sum of ad spend
	CPM · CPC · CPA	What does 1,000 impressions, one click, one conversion cost?	$\text{Spend} / \text{Impressions} \times 1000 \cdot \text{Clicks} \cdot \text{Conversions}$
	ROAS	How much revenue per unit spent?	$\text{Revenue} / \text{Spend}$

All ratios are calculated as $\text{SUM}(a) / \text{SUM}(b)$, never as an average of row-level ratios.

FINDING 1 AND 2

Reach and engagement held steady, but attention fell

Total Reach over time

ER over time

VTR over time

Monthly totals. Variation = (max – min) / average: Reach 3.95%, ER 1.47%, VTR 47.98%. Static values, full period.

- Reach stayed near 14.5M to 15.1M per month and engagement near 3.8%.
- VTR is the exception: 13.54% in September, 11.50% in October, 8.35% in November, 9.91% in December.

Efficiency followed the same pattern

CPA over time

ROAS over time

CPA rose from 45.02 (Sep) to 72.36 (Nov), then eased to 61.05. ROAS fell from 0.65 to 0.41, then recovered slightly to 0.48.

Reading: the month with the lowest attention is also the month with the worst cost per conversion and the lowest ROAS. A natural next question is whether older content loses attention over time.

FINDING 3

Pinterest wins attention, Snapchat wins reactions

Dashed line = overall average (non filtered). Retention (VCR) is about 70% on all three platforms.

Platform	VTR	VCR	ER	CTR	CPM	CPC	CPA	ROAS
Facebook	10.81%	69.98%	2.82%	0.53%	11.01	2.06	58.93	0.48
Pinterest	12.74%	70.83%	3.51%	0.63%	14.04	2.21	49.14	0.69
Snapchat	8.80%	69.96%	5.23%	0.44%	7.02	1.61	69.95	0.27

- **Pinterest:** best on attention (VTR) and action (CTR), and the best CPA and ROAS, even with the highest CPM.
- **Snapchat:** best on interaction (ER), but the lowest attention and clicks. It is the cheapest to reach (lowest CPM and CPC) and the least efficient at converting (highest CPA, ROAS 0.27).
- **Facebook:** in the middle on attention, clicks and efficiency, and the lowest on interaction (ER 2.82%).

CPA and ROAS by platform. ROAS stays below the break-even line of 1 on all three.

FINDING 4

Three contents stand out

VTR by content IQR bounds (1.5×) (non filtered):
Limits Upper: 10.38% | Lower: 8.24%

Content Name	VTR	VCR	ER	CTR
Cometa	9.23%	85.83%	3.71%	0.46%
Coral	9.01%	74.61%	3.79%	0.45%
Dragon	9.46%	64.11%	3.73%	0.47%
Estrella	9.05%	82.01%	3.75%	0.45%
Fenix	9.3%	53.7%	3.79%	0.46%
Galaxia	22.42%	74.39%	3.79%	1.11%
Grifo	9.79%	84.94%	3.82%	0.48%
Lluvia	9.14%	52.79%	3.86%	0.45%
Luna	8.93%	84.62%	3.81%	0.44%
Medusa	9.11%	84.59%	3.73%	0.45%
Nieve	9.03%	84.97%	3.93%	0.45%
Nube	9.13%	74.33%	3.79%	0.45%
Planeta	9.01%	53.68%	3.74%	0.45%
Pulpo	8.93%	84.68%	3.84%	0.44%
Rayo	22.77%	74.36%	3.74%	1.13%
Sirena	9.56%	53.06%	3.71%	0.47%
Tiburon	22.45%	53.9%	3.74%	1.12%
Tornado	9.08%	53.52%	3.74%	0.45%
Tortuga	9.05%	74.59%	3.78%	0.45%
Unicornio	9.63%	64.65%	3.79%	0.47%

Comments: IQR bounds (1.5×) (non filtered).
Green cells: outliers above.
Red cells: outliers below.

Rayo, Tiburon and Galaxia are outliers on attention (VTR ≈ 22%) and action (CTR ≈ 1.1%). Nieve stands out slightly on ER. Retention (VCR) shows no outliers

Outliers flagged with the IQR rule (1.5×) across 20 contents. Green cells = above the upper bound. Bounds are fixed values (non filtered).

Metric	Median	Upper bound	Outliers
VTR	9.13%	10.38%	Rayo 22.77%, Tiburon 22.45%, Galaxia 22.42%
CTR	0.45%	0.52%	Rayo 1.13%, Tiburon 1.12%, Galaxia 1.11%
ER	3.78%	3.89%	Nieve 3.93% (slight)
VCR	74.4%	n/a	None

- The same three contents are outliers on attention and action, at about double the typical level.
- In the underlying data their ROAS is 1.14 (Rayo), 1.12 (Galaxia) and 1.11 (Tiburon). The next best content is 0.46. This ROAS by content is not shown on the dashboard.

NEXT STEPS AND CAVEATS

- **Next:** compare the three outlier videos with the rest (format, length, topic) to find what drives attention, and test whether the VTR decline is tied to content age.
- **Caveat:** spend, conversions and revenue are synthetic, so the efficiency results, including ROAS below 1, demonstrate the analysis and are not real business results.
- **Method:** Data Studio and Google Sheets for the dashboard; Python (pandas) for the IQR bounds and monthly variations. Static annotations are labeled non filtered.
